## CONTENTS

### **SX/IX**

Comparison of Various Reagents for Stripping Uranium-Loaded Alamine 336

*M. H. Kotze, A. C. du Preez & C. Mokwana, Mintek, South Africa*

Solvent Extraction of Uranium and Its Separation from Vanadium In Alkaline Solutions

*Zhaowu Zhu, Yoko Pranolo & Chu Yong Cheng, The Parker Centre / CSIRO Process Science and Engineering / CSIRO Minerals Down Under National Research Flagship, Australia*

Development of the Metrix™ Resin in Pulp System for Extracting Uranium from Hypersaline Acidic Solutions

*Derrin Auerswald, Bateman Engineering Projects; Marthie Kotze & Volha Yahorava, Mintek, South Africa*

Strong Acid Versus Ammonia Strip in Uranium SX Circuits

*Deon van Tonder, AMEC Australia Pty Ltd & Chuck Edwards, AMEC Americas, Canada*

Uranium Solvent Extraction Plant Designs – Where Does Copper Come Into It?

*Murdoch Mackenzie, Murdoch Mackenzie Metallurgy & Graeme Miller, Miller Metallurgical Services Pty Ltd, Australia*

Application of WINTRAY Extraction Column to a Direct Uranium Solvent Extraction Process

*Shinya Kumagai, Takashi Nakayama, Yasunori Nozoe, Shimpei Satake, Masayuki Sato, & Shinichiro Yumoto, JGC Corporation, Japan*

Advances in Bateman Pulsed Column Design and Application for Uranium Solvent Extraction

*Alan Miller, Nadav Dobrin, Einat Shooster & Oded Lerner, Bateman Advanced Technologies Ltd. (BAT), Israel*

Uranium Recovery Using DEHPA/Alamine 336 Mixed Reagent

*James Quinn & Karin Soldenhoff, ANSTO Minerals, Australia*

Removal of Trace Contaminants (Ion Exchange Technology)

*Cushla Connolly & Areski Rezkallah The Dow Chemical Company, Australia/France*

High Conc Eluate Concentration from Liquors Containing High Chloride Concentrations

*Cushla Connolly & Areski Rezkallah, The Dow Chemical Company, Australia/France*

### **Uranium Ore Leaching**

The Use of Ammonium Carbonate as Lixiviant in Uranium Leaching

*Bundjoko Kweto & Dick Groot, University of Pretoria; Janine Suthiram & Jan Rijn Zeevaart, NECSA, South Africa*

**Project Development**

Metallurgical Development of the Samphire Uranium Project  
*Simon Hall, UraniumSA Ltd, Australia*

Pilot Plant Treatment of Ore from Toro Energy's Wiluna Uranium Project  
*John Baines, Toro Energy Limited, Australia*

Leaching of Kvanefjeld Concentrate  
*Damien Krebs & Domenic Furfaro, Greenland Minerals and Energy Ltd, Australia*

Environmental Aspects of Uranium Projects  
*Gordon McPhail, SLR Consulting Australia Pty Ltd, Australia*

To Gamma or Not To Gamma: A South Texas Case Study of Uranium Detection Methods  
*Alex Ross & Caleb Ames, GAA Wireline, Australia*

**Uranium Heap Leaching Forum**

Heap Leaching Philosophy with Specific Reference to Uranium Ores  
*Petrus van Staden & Carl Bergmann, Mintek, South Africa*

The Critical Role of Gangue Element Chemistry in Heap and Agitated Leaching of Uranium Ores  
*Grenvil Dunn & Yong Yong Teo, Orway Mineral Consultants, Australia*

Uranium Heap Leach Modeling  
*Francois Geffroy, AREVA Mining BG, France & David Dixon, University of British Columbia, Canada*

Early Stage Metallurgical Evaluation of a Complex Low-Grade Uranium Project  
*Will Goodall & Julian Perkins, Aura Energy, Australia*

Uranium Recovery as a By-Product at Talvivaara Mine  
*Pertti Pekkala & Annika Hämäläinen, Talvivaara Mining Company Ltd., Finland; Ken Gullen, Cameco Corporation, Canada & Erkki Paatero, Outotec Oyj, Finland; presented by Lauri Palmu, Talvivaara Mining Company Ltd., Finland.*

Development of the Letlhakane Uranium Deposit, Botswana  
*David Cairns, Jerome Randabel, Paul Thomson & Paul Woolrich, A-CAP Resources, Australia/Botswana; Grenvil Dunn, Orway Mineral consultants; Randall Pyper, Kappes Cassidy, & Assoc; Peter Wilkinson, SGS Lakefield Oretest & Alan Taylor, ALTA Metallurgical Services, Australia*

**ALTA 2012  
URANIUM CONFERENCE**

**URANIUM HEAP LEACHING FORUM**

# URANIUM HEAP LEACH MODELING

By

<sup>1</sup>François Geffroy & <sup>2</sup>David Dixon

<sup>1</sup>Mining BG, Areva, France

<sup>2</sup>University of British Columbia, Canada

Presenter and Corresponding Author

## A sustained production growth

**N# 2**  
**world producer in 2011**

**8790\*** tones of uranium in 2011

+ **9%** since 2010 (despite closure of McClean Lake mine)

AREVA production growth, ktU

**3 countries with 4 operating mines in 2011**

\*Accessible share of production, includes 6tU produced in France  
\*\* Operated by CAMECO

## Heap leaching issues

### ▶ Ore preparation

- ◆ Crushing mesh ?

### ▶ Agglomeration

- ◆ How much water ? acid ? binder ?

### ▶ Stacking

- ◆ Heap dimensions ? Target density ?

### ▶ Leaching

- ◆ Irrigation pattern ? Flow ?
- ◆ Acid concentration ? Oxidant ?
- ◆ Leach time, number of cycles ?
- ◆ Expected recovery ? Acid consumption ?

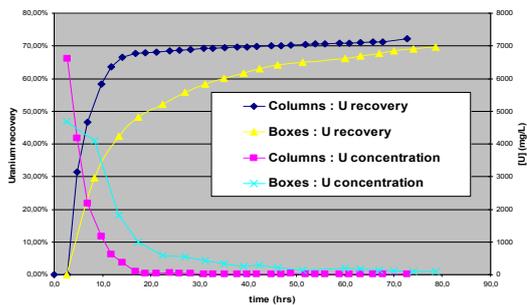

## Column and crib tests

- ▶ Operating conditions optimisation
- ▶ Scale-up effect analysis

Agglomerated ore at Somair

Imouraren column tests (4m x 0,24m)

Cribs Somair (3m x 3m x 6m)

## Heap Leach Modeling stakes

Stakes

**Optimising production and costs**  
Around 45% of U reserves involve heap leaching

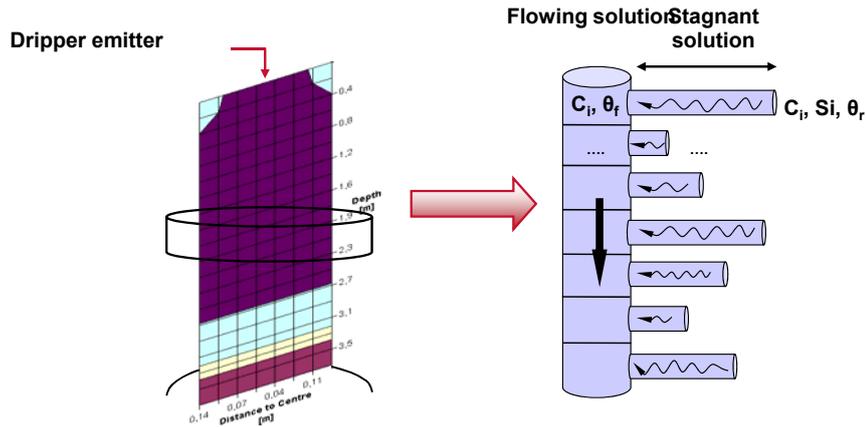

Objectives

- 1 Understanding the physics (flow, chemistry, transport) at various scales
- 2 Predicting the recovery through simulations → Optimising the operational parameters
- 3 Coupling column leach tests and modeling to reduce the overall number of tests

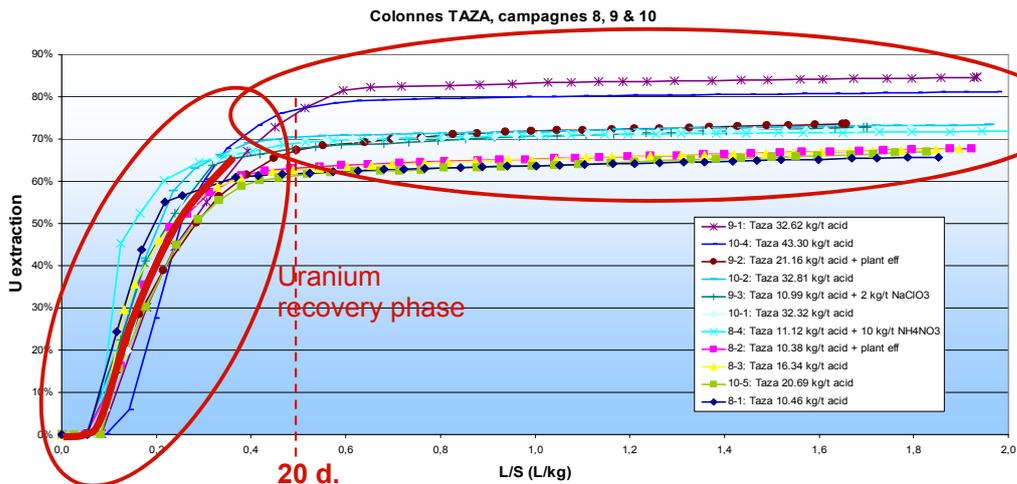

## HeapSim2D model

### ► Hypotheses

- ◆ Homogeneous medium
- ◆ Cylindrical section under a dripper emitter
- ◆ No plugging, no subsidence

## Column leach tests data analysis

- Whatever the agglomeration conditions, leaching is practically done at  $L/S = 0,5$  (20 d.)
- Initial slopes are similar → rinsing phenomenon
- Reactive agglomeration is a key step of heap leaching

## Agglomeration tests

▶ **Objective**

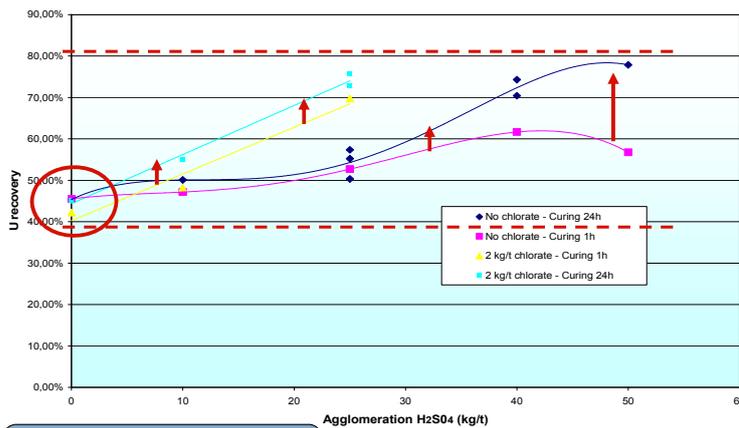

- ◆ Knowing the initial state before irrigation
- ◆ Understanding the chemistry (kinetics and equilibrium)
- ◆ Better characterisation of the initial ore

▶ **Protocol**

<b>H<sub>2</sub>SO<sub>4</sub> (kg/t)</b>	0, 10, 25, 40, 50
<b>NaClO<sub>3</sub> (kg/t)</b>	0, 2
<b>Curing time (h)</b>	1, 24, 48
<b>Temperature (°C)</b>	50, 60
<b>In-depth chemical analyses</b>	U, pH, Eh, Fe, major metals, mineralogy

## Main results

- ▶ The majority of Uranium is dissolved after agglomeration
- ▶ The oxidation ratio in the ore is **45% U(VI) + 55% U(IV)**
- ▶ Curing time has a positive effect (concentrated acid medium). Especially at high acidity.

**Analysis**

- ▶ At low acidity, there is not enough Fe<sup>3+</sup> in solution for oxidant to influence U recovery
- ▶ At high acidity, a longer curing time helps dissolving enough Fe<sup>3+</sup> from the gangue, to increase U recovery.

## Chemical model

► Only 6 « minerals »

- ◆ U(IV) → UO<sub>2</sub>
- ◆ U(VI) → UO<sub>3</sub>
- ◆ Fe(II) → FeO
- ◆ Fe(III) → Fe<sub>2</sub>O<sub>3</sub>
- ◆ gangue → MO
- ◆ Carbonates → MCO<sub>3</sub>

### HYPOTHESES

- UO<sub>3</sub>/UO<sub>2</sub> = 45%/55%
- Fe<sub>2</sub>O<sub>3</sub>/FeO = 45%/55%
- Gangue = Si + Al

► A single standard dissolution rate equations for each

4 calibrated parameters

$$r_{MO} = \rho_b k_{MO} \exp \left[ -\frac{E_{MO}}{R} \left( \frac{1}{T} - \frac{1}{T_{0,MO}} \right) \right] c_{Acid}^{\theta_{MO}} (c_{MO} - f_{MO} c_{MO,0})^{\phi_{MO}}$$

## Transport parameters measurement

- ✓ Model of Van Genuchten and Mualem for unsaturated flow in a porous media
- Measured and calibrated parameters

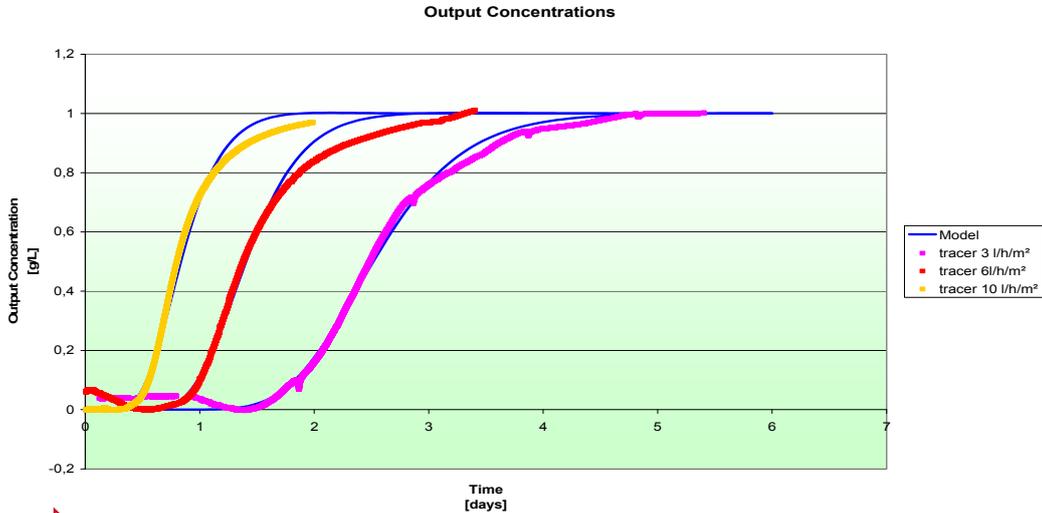

- The ore reaction to flow variations provides the flow parameters
- Tracer study
- **Allows modeling at any scale**

Dedicated column, equipped with tensiometers and scale

Data

## Tracer tests

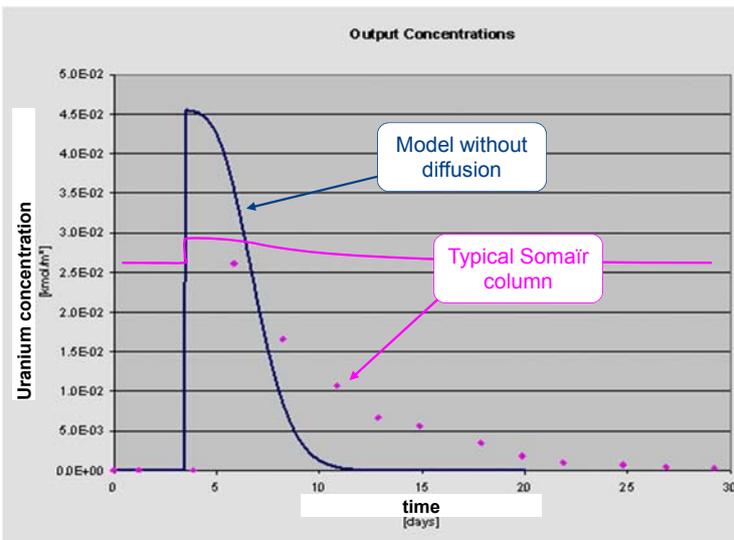

► KCl used as a tracer to calibrate dispersion at various flowrates

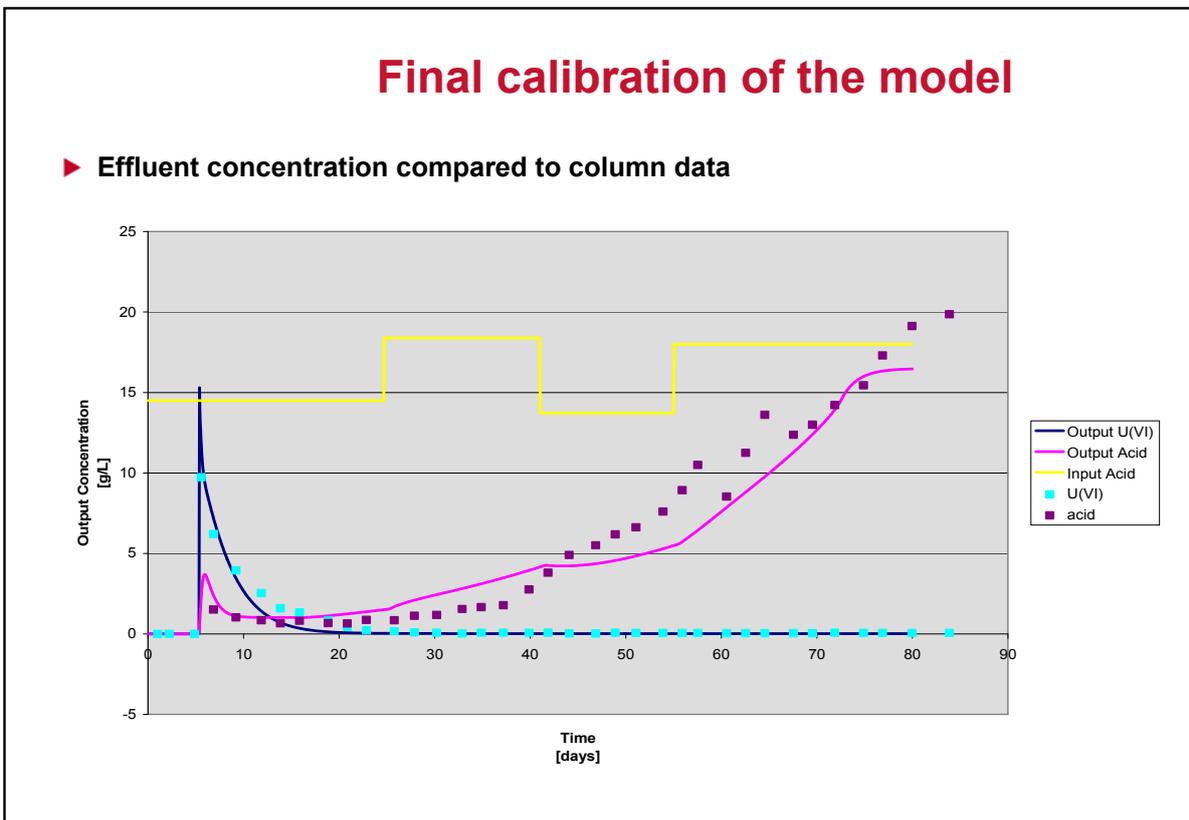

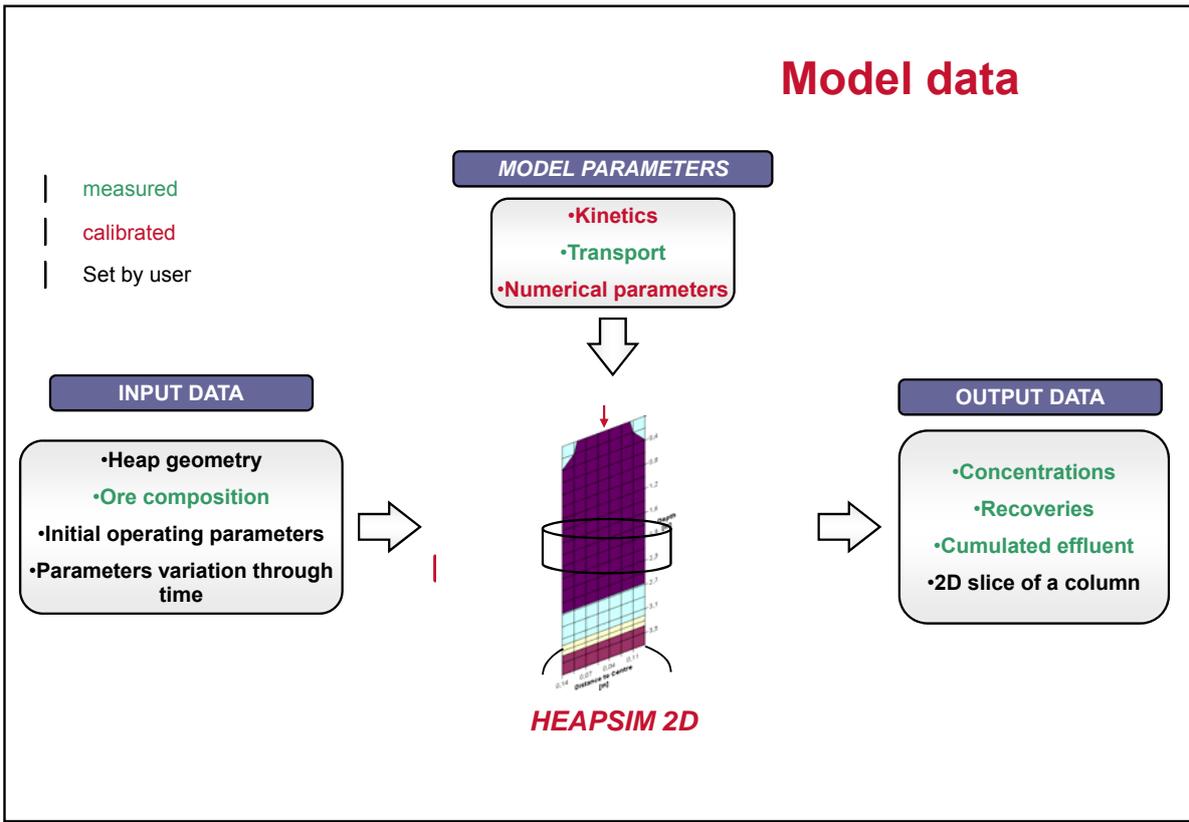

Validation of measured flow parameters

## Influence of diffusion effects

► Diffusion effects taken into account within the model

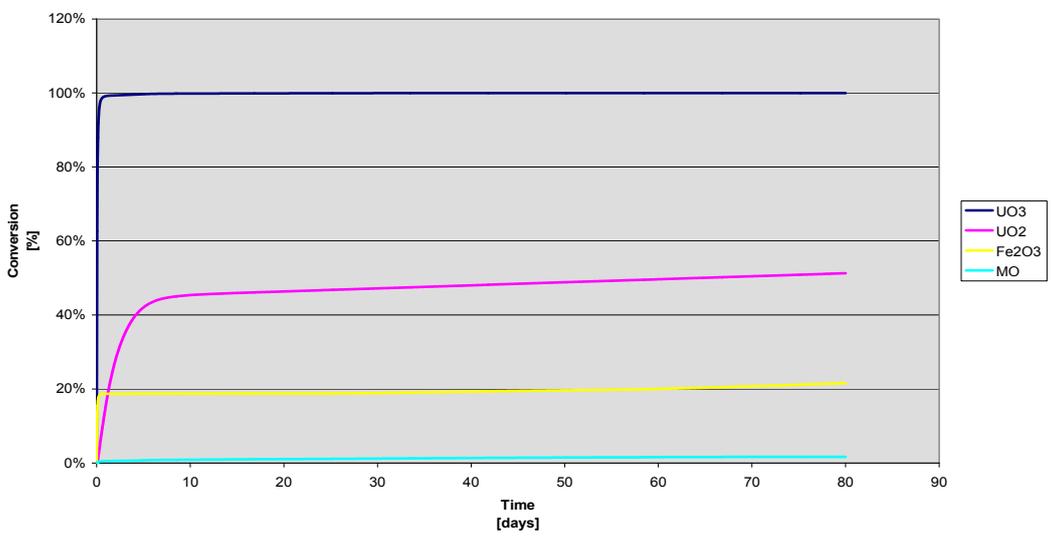

- Uranium recovery is slower than expected with a rinsing model
- Uranium is however almost totally dissolved initially
- Evidence of diffusion, unusual in heap leaching
- Hypothesis strengthened by the presence of clay (~15%)
- Possible sorption of U(VI) could explain this result

## Elements dissolutions

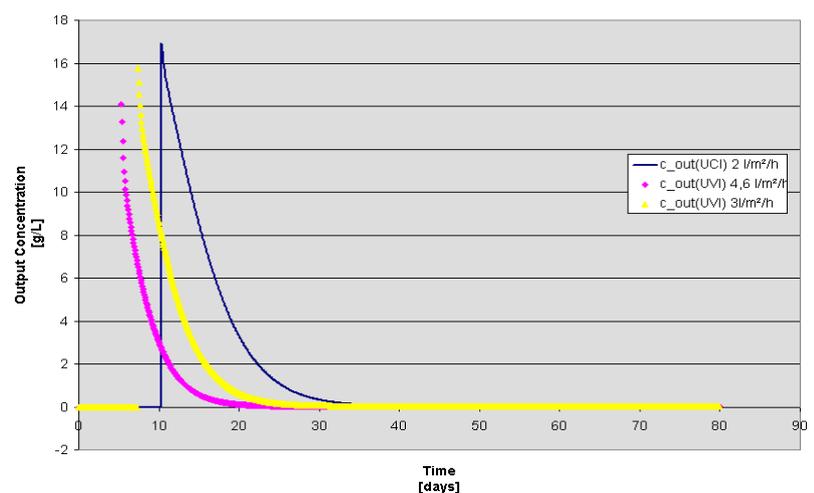

Conversions

**Elements recovery**

## Irrigation flowrate study

Output Concentrations

- ▶ From a modelling point of view, the faster the flow, the better
- ▶ From an operational point of view, plugging issues limit the maximum flow to around 3 l/m²/h

## Conclusion

### ▶ Transport mechanism are confirmed

- ◆ VGM parameters successfully apply to leaching column simulations
- ◆ Capillary pressure is high enough to rapidly balance horizontal flow. Flow is pseudo-1D up to 30 cm dripper spacing.
- ◆ Dispersion and diffusion have a significant effect on U recovery time
- ◆ Uranium recovery from the heap is mainly a transport issue

### ▶ Chemistry is better understood

- ◆ Maturation should be privileged. Irrigation almost stops dissolution reactions.
- ◆  $[\text{Fe}^{3+}]$  is very dependant on acid (high clay content) and needs to be precisely monitored on site
- ◆ Acid typically dissolves 1-2% of gangue. Highly dependant on agglomeration conditions (limited by using one single gangue mineral)

### ▶ Column leach simulations will be used

- ◆ As a complement to column leach experiments during ore studies
- ◆ On site to follow production and anticipate variations on uranium concentration in PLS
